

An Introduction to High Performance Computing on the CSD3 Cluster

Paul Sumption
support@hpc.cam.ac.uk

Research Computing Services (<http://www.hpc.cam.ac.uk/>)
University Information Services (<http://www.uis.cam.ac.uk/>)

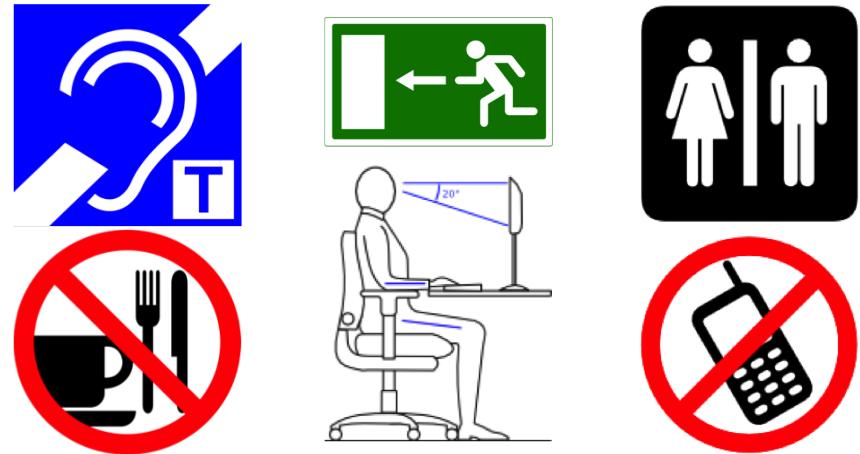

17th Oct 2018 / CSD3 User Training

- ▶ Please sign in on the [attendance sheet](#).
- ▶ Please fill in the [online feedback](#) at the end of the course: There is a link to this on your desktop.
- ▶ Keep your belongings with you.
- ▶ Course files can be downloaded from: www.cs3.cam.ac.uk

Plan of the Course

10:00 Part 1: Course Introduction
10:15 Part 2: HPC - Basic Concepts
11:00 BREAK
11:20 Part 3: HPC - Facilities
12:00 Part 4: HPC - Connecting
13:00 LUNCH
14:00 Part 5: HPC - User Environment
15:00 Part 6: HPC - Submission scripts
16:30 FEEDBACK and CLOSE

Part I: Introduction

Your trainer for today will be:

- ▶ Paul Sumption — Research Computing Technical Liaison
- ▶ Please ask questions and let us know if you need assistance.

Introduction: Training accounts

- ▶ For our practical exercise's we will use HPC training accounts.
- ▶ You will find a piece of paper on your desk.
- ▶ 1: Your training account details.
- ▶ Your training account will only be valid for today.

Introduction: Login node

- ▶ For our practical exercise's we will use the login node:
login-cpu.hpc.cam.ac.uk.
- ▶ Later in the course you will see that different nodes types may require you to use other login nodes.

- ▶ Boring but very, very important...
- ▶ Cambridge IT is under constant attack by would-be intruders.
- ▶ Your data and research career is threatened by intruders.
- ▶ Cambridge systems are high profile and popular targets.
- ▶ Don't let intruders in.

1. Keep your password (or private key passphrase) safe.
2. Always choose strong passwords.
3. Your UIS password is used for multiple systems so keep it secure!
4. Keep the software on your laptops/tablets/PCs up to date this includes home computers especially if you are using the VPN to connect in.
5. Don't share accounts (this is against the rules anyway).

Pre-requisites

- ▶ Pre-requisites: Basic Unix/Linux command line experience
- ▶ Suggested Courses:
 - ▶ Unix: Introduction to the Command Line Interface (Self-paced)
<https://www.training.cam.ac.uk/ucs/Course/ucs-unixintro1>
 - ▶ Shell scripting experience is desirable:
 - ▶ Unix: Simple Shell Scripting for Scientists
<https://www.training.cam.ac.uk/ucs/Course/ucs-scriptsci>

Navigating your terminal

Useful commands for navigating your terminal.

- ▶ `cd <dirname>` - change into a directory
- ▶ `ls <dirname>` - list the contents of a directory
- ▶ `cd` or `cd ~` - change into your home folder
- ▶ `cd ..` - change back one folder
- ▶ `man ls` - will bring up the manual page for the ls command
- ▶ `pwd` - print working directory

What types of big problem might require a “Big Computer”?

Compute Intensive: A single problem requiring a large amount of computation.

Memory Intensive: A single problem requiring a large amount of memory.

Data Intensive: A single problem operating on a large amount of data.

High Throughput: Many unrelated problems to be executed in bulk.

Part II: Basics

14 of 103

Basics: Compute Intensive Problems

- ▶ Distribute the [work](#) for a [single problem](#) across multiple CPUs to reduce the execution time as far as possible.
- ▶ Program workload must be *parallelised*:
 - Parallel programs split into copies (processes or threads). Each process/thread performs a part of the work on its own CPU, concurrently with the others.
 - A well-parallelised program will fully exercise as many CPUs as there are processes/threads.
- ▶ The CPUs typically need to exchange information rapidly, requiring specialized communication hardware.
- ▶ Many use cases from Physics, Chemistry, Engineering, Astronomy, Biology...
- ▶ The traditional domain of [HPC](#) and the [Supercomputer](#).

Basics: Scaling & Amdahl's Law

- ▶ [Using more CPUs is not necessarily faster](#).
- ▶ Typically parallel codes have a [scaling limit](#).
- ▶ Partly due to the system overhead of managing more copies, but also to more basic constraints;
- ▶ Amdahl's Law (idealized):

$$S(N) = \frac{1}{(1 - p + \frac{p}{N})}$$

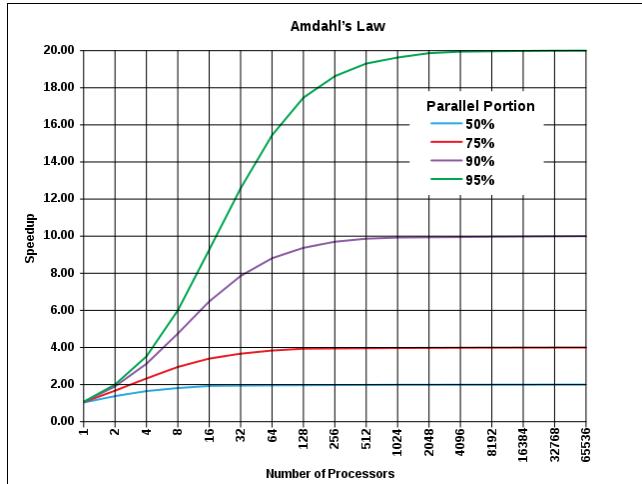

where

$S(N)$ is the fraction by which the program has sped up relative to $N = 1$

p is the fraction of the program which can be parallelized

N is the number of CPUs.

Basics: Amdahl's Law

<http://en.wikipedia.org/wiki/File:AmdahlsLaw.svg>

Basics: Data Intensive Problems

- Distribute the **data** for a **single problem** across multiple CPUs to reduce the overall execution time.
- The **same** work may be done on each data segment.
- Rapid movement of data to and from disk is more important than inter-CPU communication.
- Big Data** problems of great current interest -
- Hadoop/MapReduce
- Life Sciences (genomics) and elsewhere.

The Bottom Line

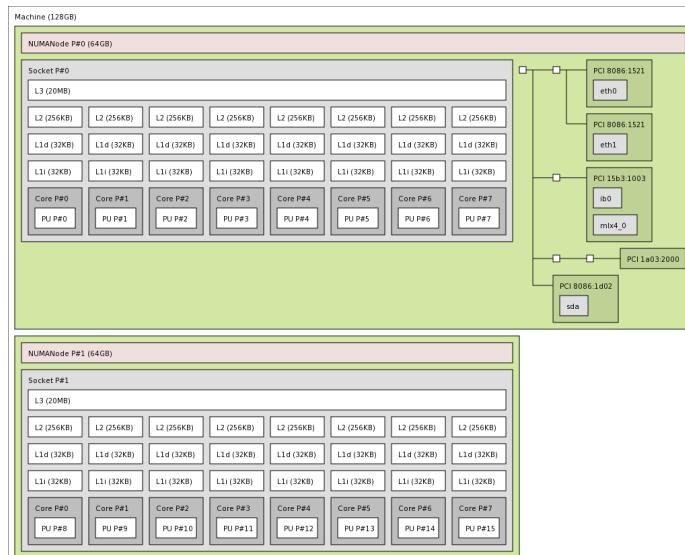

- Parallelisation requires effort:
 - There are libraries to help (e.g. [OpenMP](#), [MPI](#)).
 - First optimise performance on one CPU, then make p as large as possible.
- The scaling limit: eventually using more CPUs becomes **detrimental** instead of helpful.

Basics: High Throughput

- Distribute **independent**, **multiple problems** across multiple CPUs to reduce the overall execution time.
- Workload is trivially (or *embarrassingly*) parallel:
 - Workload breaks up naturally into *independent* pieces.
 - Each piece is performed by a separate process/thread on a separate CPU (concurrently).
 - Little or no inter-CPU communication.**
- Emphasis is on throughput over a period, rather than on performance on a single problem.
- Compute intensive capable \Rightarrow high throughput capable
- Compute intensive capable \neq high throughput capable**

- ▶ Require aggregation of large memory into a [single system image](#) (i.e. a single computer running Linux).
- ▶ Technically more challenging to build machines (very fast, low latency interconnection between [all CPUs](#) and [all memory](#)).
- ▶ Coding/porting easier (memory appears seamless).
- ▶ Optimisation harder (memory is actually highly nonuniform).
- ▶ Historically, the arena of large [SGI](#) systems.
- ▶ Nowadays, similar complexity inside single commodity servers.

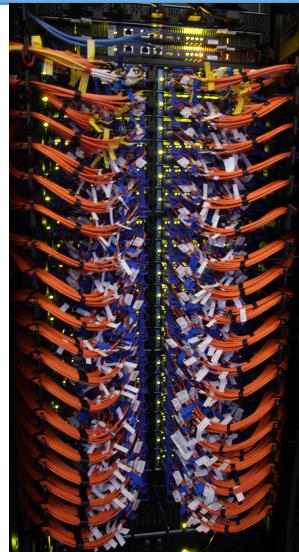

- ▶ Today's commodity servers already aggregate both CPUs and memory to make a single system image in a single box.
- ▶ Even small computers now have multiple CPU cores per socket
⇒ [each socket is a Symmetric Multi-Processor \(SMP\)](#).
- ▶ Larger computers have multiple sockets (each with local memory):
all CPU cores (unequally) share the node memory
⇒ the node is a [shared memory](#) multiprocessor with Non-Uniform Memory Architecture ([NUMA](#)) but users still see a single computer ([single system image](#)).

- ▶ A supercomputer aggregates contemporary CPUs and memory to obtain increased computing power.
 - ▶ Usually today these are [clusters](#).
1. Take some (multicore) CPUs plus some memory.
 - ▶ Could be an off-the-shelf server, or something more special.
 - ▶ A NUMA, shared memory, multiprocessor building block: a [node](#).

Basics: How to Build a Supercomputer

2. Connect the nodes with one or more **networks**.
Faster network for **inter-CPU communication across nodes**.
Slower network for **management and provisioning**.
Storage may use either.

Basics: How to Build a Supercomputer

3. Logically bind the nodes
 - ▶ Clusters consist of distinct nodes (i.e. separate Linux computers) on common private network(s) and controlled centrally.
 - * Private networks allow CPUs in different nodes to communicate.
 - * Clusters are **distributed memory** machines:
Each process/thread sees only its local node's CPUs and memory (without help).
 - * Each process/thread must fit within a single node's memory.

Basics: Programming a Multiprocessor Machine

- ▶ Non-parallel (serial) code
 - * **For a single node as for a workstation.**
 - * Typically **run as many copies per node as CPUs**, assuming node memory is sufficient.
 - * **Replicate across multiple nodes.**
- ▶ Parallel code
 - * **Shared memory methods within a node.**
E.g. pthreads, OpenMP.
 - * **Distributed memory methods spanning multiple nodes.**
Message Passing Interface (MPI).

Basics: Summary

- ▶ **Why have a supercomputer?**
 - ▶ Big single problems, many problems, Big Data.
- ▶ Most current supercomputers are **clusters** of separate **nodes**.
- ▶ Each node has **multiple CPUs** and **non-uniform shared memory**.
- ▶ **Parallel** code uses shared memory (**pthreads/OpenMP**) within a node, distributed memory (**MPI**) spanning multiple nodes.
- ▶ **Non-parallel** code uses the memory of one node, but may be copied across many nodes (i.e. High Throughput, single core).

Part III: HPC Facilities

- ▶ Cambridge Service for Data Driven Discovery
- ▶ Peta4 — Intel CPU cluster
- ▶ Wilkes2 — NVIDIA GPU cluster
- ▶ Hadoop-based data analytic platform
- ▶ Burst buffer
- ▶ Industry users through CORE.

Peta4-Skylake

- ▶ Each compute node:
 - * 2x16 cores, Intel Skylake 2.6 GHz **32 CPUs**
 - * 192 GB or 384 GB RAM **6 GB or 12 GB per CPU**
 - * 100 Gb/sec Omni-Path **10 GB/sec (for MPI and storage)**
- ▶ 768 compute nodes, 384 are 192GB RAM nodes and 384 are 384GB RAM nodes
- ▶ 8 login nodes (login-cpu.hpc.cam.ac.uk)

Wilkes2-GPU

- ▶ Each compute node:
 - * 4 × NVIDIA P100 GPU **4 GPUs**
 - * 1x12 cores, Intel Broadwell 2.2 GHz **12 CPUs**
 - * 96 GB RAM **96 GB RAM**
 - * 100 Gb/sec (4X EDR) Infiniband. **10 GB/sec (for MPI and storage)**
- ▶ 90 compute nodes.
- ▶ 8 login nodes (login-gpu.hpc.cam.ac.uk).

- ▶ Each compute node:
 - * 64 cores, Intel Phi 7210**256 CPUs**
 - * 96 GB RAM**96 GB RAM**
 - * 100 Gb/sec Omni-Path**10 GB/sec (for MPI and storage)**
- ▶ 342 compute nodes
- ▶ Shared login nodes with Peta4-Skylake

- ▶ Multi-petabytes split across multiple filesystems with tape.
- ▶ Lustre cluster filesystem:
 - * Multiple RAID6 back-end disk volumes.
 - * Multiple object storage servers.
 - * Single metadata server.
 - * Tape-backed HSM on newest filesystems.
 - * 4 GB/sec overall read or write.
 - * Prefers big read/writes over small.
- ▶ For active HPC work only.

Obtaining an Account and Support

- ▶ To apply for an account, complete our online form:
<https://www.cs3.cam.ac.uk/services/applying-for-resources>
- ▶ We will contact your PI
- ▶ Core hours are allocated to your PI

Obtaining an Account and Support

- ▶ For support enquiries please email our Service Desk:
support@hpc.cam.ac.uk
- ▶ Please try to give plenty of detail:
- ▶ Which nodes are you using? job id? modules loaded? etc

Part IV: Using HPC

- ▶ When connecting to the cluster will we use the SSH secure protocol only.
- ▶ We will use the Linux workstations during this course
- ▶ Please check your workstation is booted into Ubuntu Linux, ask if you need help with this.
- ▶ You are welcome to use your own laptop, however you may need to install some software in order to connect.
- ▶ Later in this section of the slides we will cover the software you may need to install on your own computer.

Basics: Connecting

- ▶ SSH secure protocol only.
Supports login, file transfer, remote desktop...
- ▶ HPCS now allows direct access from outside of the CUDN.
It is still worth configuring the UIS VPN service
<http://www.ucs.cam.ac.uk/vpn>
Useful for other CUDN only services.

Basics: Connecting

- ▶ To access the Peta4-Skylake (CPU cluster) nodes:
`ssh <username>@login-cpu.hpc.cam.ac.uk`
- ▶ To access the Peta4-KNL (KNL cluster) nodes:
`ssh <username>@login-knl.hpc.cam.ac.uk`
- ▶ To access the Wilkes2-GPU (GPU cluster) nodes:
`ssh <username>@login-gpu.hpc.cam.ac.uk`

Connecting: Linux Clients

- ▶ ssh, scp, sftp, rsync
Installed (or installable), in Ubuntu we will use 'Terminal'.
- ▶ X Windows, for using graphical applications remotely This is already installed on your desktop.

Connecting: Login

- ▶ From Linux/MacOSX/UNIX (or Cygwin):
`ssh -Y abc123@login-cpu.hpc.cam.ac.uk`
- ▶ From graphical clients:
Host: `login-cpu.hpc.cam.ac.uk`
Username: `abc123` (your UCAM account name)
- ▶ login-cpu.hpc will map to a random login node
i.e. one of login-e-9, ..., login-e-16
NB you'll never connect to the head node.

Connecting: First time login

- ▶ The first connection to a particular hostname produces the following:

```
The authenticity of host 'login-e-10.hpc.cam.ac.uk (128.232.224.47)'  
can't be established.  
RSA key fingerprint is  
0b:ef:59:90:fb:13:4a:c9:56:82:7b:cd:4b:2b:e1:3b.  
Are you sure you want to continue connecting (yes/no)? yes  
Warning: Permanently added 'login-sand2.hpc.cam.ac.uk' (RSA) to the  
list of known hosts.
```
- ▶ One should always check the fingerprint before typing "yes".
- ▶ Graphical SSH clients should ask a similar question.
- ▶ Designed to detect fraudulent servers.

Connecting: First time login

- ▶ You may be presented with any of the following fingerprints (depending on your client):

```
MD5:0b:ef:59:90:fb:13:4a:c9:56:82:7b:cd:4b:2b:e1:3b  
SHA256:sSkVfpwjwiFvxLcdPoDpN8IsN3kt0ZSywhDhPKZPAG
```

```
MD5:34:9b:f2:d2:c6:b3:5c:63:99:b7:27:da:5b:c8:16:fe  
SHA256:HsiY10e0M8tS6JwR76PeQQA/VB7r8675BzG50YQ4h34
```

```
MD5:64:7c:7c:ff:05:9d:0e:dc:06:fe:f1:c2:10:37:7a:85  
SHA256:wq91jBfPa71XXpQq+rk5JTBXLJ0/kXj0c5A7rp4ENzA
```

Connecting: File Transfer

- ▶ From Linux/MacOSX/UNIX (or Cygwin):

```
rsync -av old_directory/
```

```
abc123@login-cpu.hpc.cam.ac.uk:/home/abc123/new_directory
```

copies contents of old_directory to `~`/home/abc123/new_directory.

```
rsync -av old_directory
```

```
abc123@login-cpu.hpc.cam.ac.uk:/home/abc123/new_directory
```

copies old_directory (and contents) to

`~`/home/abc123/new_directory/old_directory.

- * For transfers in the opposite direction, place the remote machine as the first argument.

Basics: Connecting from other clients

- ▶ When using your own computer you may need to install some software in order to connect.
- ▶ There are quite a few choices of software packages for this, we will just cover a few.
- ▶ Our website
<https://www.cs3.cam.ac.uk/using-clusters/connecting> covers this in more detail.

Connecting: MacOSX/UNIX Clients

- ▶ ssh, scp, sftp, rsync

Installed (or installable) OS X has a native terminal package. This can be launched by clicking Apple >Go >Utilities and then clicking the Terminal icon.

- ▶ TurboVNC (for remote desktop, 3D optional)

<http://sourceforge.net/projects/turbovnc/files/>

- ▶ On MacOSX, install XQuartz to display remote graphical applications.

<http://xquartz.macosforge.org/landing/>

Connecting: Windows Clients

- ▶ putty, pscp, psftp

<http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html>

- ▶ WinSCP

<http://winscp.net/eng/download.php>

- ▶ TurboVNC (remote desktop, 3D optional)

<http://sourceforge.net/projects/turbovnc/files/>

- ▶ Cygwin (provides an application environment similar to Linux)

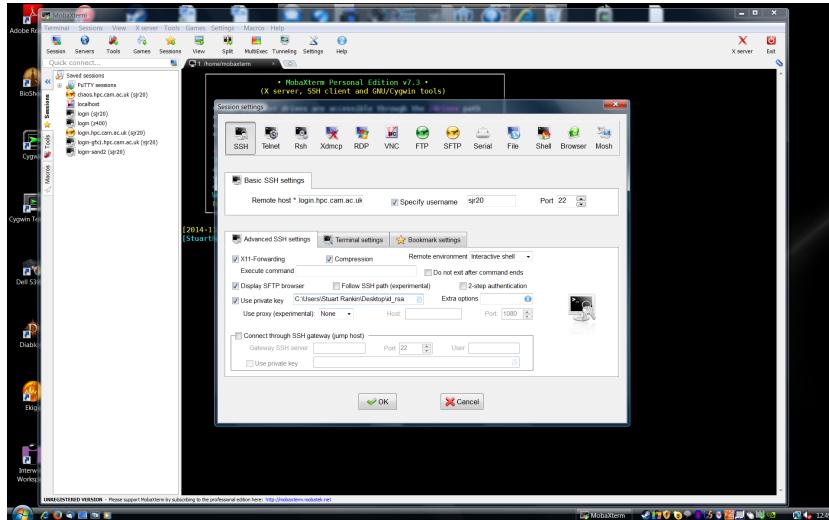

<http://cygwin.com/install.html>

Includes X server for displaying graphical applications running remotely.

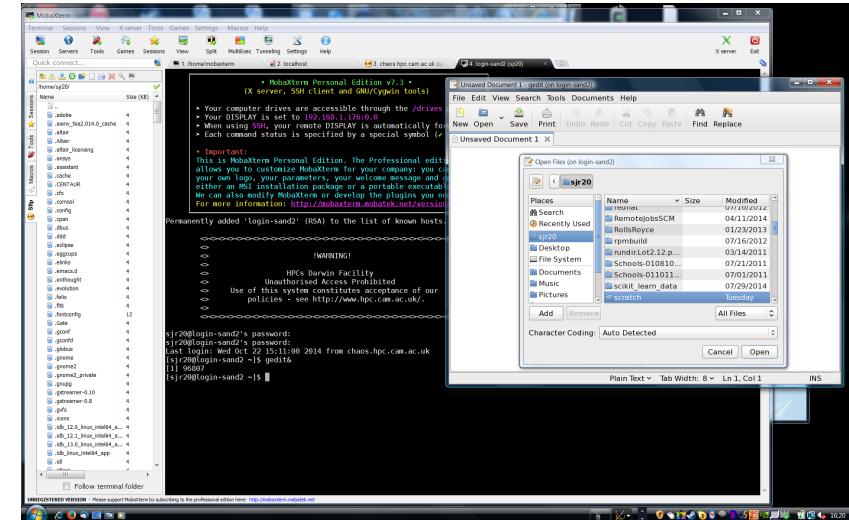

- ▶ MobaXterm

<http://mobaxterm.mobatek.net/>

MobaXterm SSH (Windows)

MobaXterm SSH (Windows)

Simple command line operations

- ▶ Some simple exercises will help us gauge your experience.
- ▶ Exercise 1: Login with SSH
- ▶ Exercise 2: SFTP file transfer
- ▶ Exercise 3: Unzip the excercises.tar file
- ▶ Exercise 4: Navigating the command line
- ▶ Exercise 5: Learn more about a command

Exercise 1: Login

Using a Linux terminal you will login to the cluster with your HPC training account.

- ▶ Start the terminal by double clicking on the terminal icon
- ▶ In your terminal enter:
ssh -Y abc123@login-cpu.hpc.cam.ac.uk
Replace abc123 with your training account username
- ▶ Enter your password as supplied on the sheet
- ▶ Leave this terminal open, you will need it for exercise 3,4 and 5!

Exercise 2: Transfer some files

You will need to transfer the exercise files to the cluster.

- ▶ Open a new Linux terminal on your training computer.
- ▶ Enter this command: `cd ~\Course_material`
- ▶ Check the file 'exercises.tar' is in your directory listing
- ▶ Hint: `ls`

Exercise 3: Unzip the exercises.tar file

- ▶ In a terminal logged into the cluster: (see exercise 1.)
- (a) Use the `ls` to list your home folder contents — you should see the copy of `exercises.tar`.
- Hints:* Do `cd ~` then `ls -al`. Note that `cd ~` will take you back to your home directory.
- (b) Unpack the tar archive to create an exercise subdirectory.
- Hints:* Do `tar -xvf exercises.tar`
- (c) Move the exercise subdirectory to a new directory.
- Hints:* Do `mv exercises myexercises`

Exercise 2: Transfer some files

Transfer the `exercises.tar` to your HPC home folder.

- ▶ In the local terminal on your training computer enter the command:
 - ▶ `sftp abc123@login-cpu.hpc.cam.ac.uk`
Change abc123 to your training account username
- ▶ The command: `put exercises.tar` will transfer the file from your local computer to the remote one
- ▶ Check the file 'exercises.tar' is in your directory listing
- ▶ Hint: `ls`
- ▶ Type 'exit' to close the local terminal

Exercise 4: File listings

- ▶ In a terminal logged into the cluster: (see exercise 1.)
- ▶ [(a)](a) List the contents of your current directory `ls`. This won't show everything — use `ls -al` for a long listing showing all files. Initially you will start in your home directory — use `pwd` to print the name of your current working directory. If you get lost, you can always do `cd` without arguments to return to your home directory.
- ▶ (b) Focus your long listing on **all files with names beginning "myexercises"**.
Hints: Do `ls -al myexercises*`
- ▶ (c) Print a long listing of the subdirectory `myexercises`.
Hints: Do `ls -al myexercises/`.

Exercise 5: Learn more about a command

- ▶ In a terminal logged into the cluster: (see exercise 1.)
 - (a) View the man page for the `cp` command by doing `man cp`. Use **SPACE** to page down and **b** to page up. Press **q** to exit the manual page command.
 - (b) View the man pages for the `mkdir` and `mv` commands.

Part V: Using HPC

Using HPC: User Environment

- ▶ Scientific Linux 7.4 (**Red Hat Enterprise Linux 7.4 rebuild**)
 - ▶ bash shell
 - ▶ Gnome or XFCE4 desktop (**if you want**)
 - ▶ GCC compilers and other development software.
- ▶ But you don't need to know that.

User Environment: Filesystems

When you apply for an HPC account a home directory is created for you.

- ▶ `/home/abc123`
 - ▶ 40GB quota.
 - ▶ Visible equally from all nodes.
 - ▶ Single storage server.
 - ▶ Hourly, daily, weekly snapshots copied to tape.
 - ▶ Not intended for job outputs or large/many input files.
- ▶ `/rds/user/abc123/hpc-work`
 - ▶ Visible equally from all nodes.
 - ▶ Larger and faster (1TB initial quota).
 - ▶ Intended for job inputs and outputs.
 - ▶ **Not backed up.**

- ▶ We have several storage services for users that need to exceed 1TB.
- ▶ <http://www.uis.cam.ac.uk/initiatives/storage-strategy/storage-services>
- ▶ The most relevant services to HPC are RCS and RDS.
- ▶ RCS - Research Cold Store is for data that isn't changing, data goes to disk then two sets of tapes.
- ▶ RDS - Research Data Store, non backed up high performance storage for projects.

- ▶ ZFS snapshots on /home are taken hourly, daily and weekly
- ▶ **No backups are made of data in the RDS directories - take care when deleting.**
- ▶ Snapshots are not backups, they are retained for two weeks
- ▶ **Very short lived files are unlikely to get written to snapshots**
- ▶ The file needs exist long enough to get into a snapshot.
- ▶ It is possible to search /home/.zfs/snapshot and browse the snapshots
- ▶ Locate the most recent version of the file then copy it back to your home folder

- ▶ quota

```
[ps459@login-e-13 hpc-work]$ quota
Filesystem GiBytes quota limit grace files quota limit grace User/group
/home      12.4   40.0  40.0   0     ----- No ZFS File Quotas ----- U:ps459
/rds-d1    89.2  1024.0 1126.4   -    757345 1048576 1048576   - G:ps459
/rds-d1    22.1  1024.0 1024.0   -   113475 1048576 1048576   - G:rds-ps459-test
```

- ▶ Aim to stay below the soft limit (*quota*).
- ▶ Once over the soft limit, you have 7 days grace to return below.
- ▶ When the grace period expires, or you reach the hard limit (*limit*), no more data can be written.
- ▶ It is important to rectify an out of quota condition ASAP.

- ▶ quota

```
[ps459@login-e-13 hpc-work]$ quota
Filesystem GiBytes quota limit grace files quota limit grace User/group
/home      12.4   40.0  40.0   0     ----- No ZFS File Quotas ----- U:ps459
/rds-d1    89.2  1024.0 1126.4   -    757345 1048576 1048576   - G:ps459
/rds-d1    22.1  1024.0 1024.0   -   113475 1048576 1048576   - G:rds-ps459-test
```

- ▶ Aim to stay below the soft limit (*quota*).
- ▶ Once over the soft limit, you have 7 days grace to return below.
- ▶ When the grace period expires, or you reach the hard limit (*limit*), no more data can be written.
- ▶ It is important to rectify an out of quota condition ASAP.

- ▶ Be careful and if unsure, please ask support.
 - ▶ Can lead to [accidental destruction](#) of your data or [account compromise](#).
- ▶ Avoid changing the permissions on your home directory.
 - ▶ Files under /home are particularly security sensitive.
 - ▶ Easy to break passwordless communication between nodes.

- ▶ Free software accompanying [Red Hat Enterprise](#) is (or can be) provided.
- ▶ Other software (free and non-free) is available via [modules](#).
- ▶ Some proprietary software may not be generally accessible.
- ▶ See <http://www.hpc.cam.ac.uk/using-clusters/software>.
- ▶ New software may be possible to provide on request.
- ▶ [Self-installed software must be properly licensed](#).
- ▶ *sudo will not work. (You should be worried if it did.)*

- ▶ Modules load or unload additional software packages.
- ▶ Some are [required](#) and automatically loaded on login.
- ▶ Others are optional extras, or possible replacements for other modules.
- ▶ [Beware unloading default modules in `~/.bashrc`](#).
- ▶ [Beware overwriting environment variables such as PATH and LD_LIBRARY_PATH in `~/.bashrc`. If necessary append or prepend.](#)

- ▶ Currently loaded:

```
module list
Currently Loaded Modulefiles:
  1) dot                               2) singularity/current
  ...plus several more default modules
```
- ▶ Available:

```
module av
```

User Environment: Environment Modules

- ▶ What is:

```
module whatis openmpi-3.0.0-gcc-4.8.5-n2hvjgm
openmpi-3.0.0-gcc-4.8.5-n2hvjgm: The Open MPI Project is an open source...
```

- ▶ Load:

```
module load openmpi-3.0.0-gcc-5.4.0-4ryklvu
```

- ▶ Unload:

```
module unload openmpi-3.0.0-gcc-5.4.0-4ryklvu
```

User Environment: Environment Modules

- ▶ Matlab

```
module load matlab/r2017b
```

- ▶ Invoking matlab in batch mode:

```
matlab -nodisplay -nojvm -nosplash command
where the file command.m contains your matlab code.
```

- ▶ The current site license contains the Parallel Computing Toolbox.

User Environment: Environment Modules

- ▶ Purge and Load Defaults:

```
module purge
module load rhel7/default-peta4
```

- ▶ sbatch scripts, purge modules, load default modules, load modules you specify

- ▶ This gives you a clean environment when running a job

User Environment: Compilers

- ▶ Load a newer GCC

```
module show gcc-7.2.0-gcc-4.8.5-pqn7o2k
module load gcc-7.2.0-gcc-4.8.5-pqn7o2k
Your commands to compile your software....
```

- ▶ If you have compiled software yourself your run time environment must match compile time environment!

```
gcc -O3 -mtune=native code.c -o prog
gfortran -O3 -mtune=native code.f90 -o prog
```

```
module load openmpi-3.0.0-gcc-4.8.5-n2hvjgm
mpicc -O3 -mtune=native mpi_code.c -o mpi_prog
mpif90 -O3 -mtune=native mpi_code.f90 -o mpi_prog
```

Excercise 6: Environment Modules

- ▶ Connect to the cluster using your training account: See excercise 1 if you have closed your terminal.
- ▶ Get a list of modules that are currently loaded

Hints: [module list](#)

- ▶ Get a list of available R modules

Hints: [module av r](#)

Exercise 8: Install the R library locally

As a user you can create a local R library directory for packages that you want to install.

- ▶ Load an R module: `module load r-3.4.3-gcc-5.4.0-rbvhnga`
- ▶ Create a folder in your home for your own R package installs:
`mkdir ~/my-R-libs`
- ▶ Make R aware of the new library location:
`echo "R_LIBS_USER=~/my-R-libs" > ~/.Renviron`
- ▶ Start R: R
- ▶ Display your library paths: `.libPaths()`
- ▶ Try loading a library: `require(pander)`
- ▶ Its not insalled, lets install it: `install.packages("pander")`
- ▶ Try loading a library: `require(pander)`
- ▶ Library is now installed, lets quit R: `quit()`

Excercise 7: Run an Rscript

- ▶ Connect to the cluster using your training account: See excercise 1 if you have closed your terminal.
 - ▶ In the exercises folder you transferred earlier there is a file called `test.r`
 - ▶ Run this script using: `Rscript hello.r`
 - ▶ Load the module for: `r-3.4.3-gcc-5.4.0-rbvhnga`
- Hints: [module load r-3.4.3-gcc-5.4.0-rbvhnga](#)
- ▶ Run the script again: `Rscript hello.r`
 - ▶ What happens? what changes?

Excercise 8: Explained

- ▶ To load one of our R modules: `module load r/(version)`
- ▶ `echo " "` outputs the text between the quotes, `>` redirects the text into the `.Renviron` file.
- ▶ When we start R the `.Renviron` file is read and R will now be aware of our local library directory.
- ▶ `.libPaths()` is how to check your library locations

Exercise 9: Modules and Compilers

- ▶ Connect to the cluster using your training account: See exercise 1 if you have closed your terminal.
- ▶ Go to the `myexercises` directory.

Try to compile the `hello.c` program using the default `gcc` compiler (it will fail because there is a deliberate bug).

Hints: `gcc hello.c -o hello`

- ▶ To fix the problem, open the `hello.c` file in the `gedit` editor.

Hints: Launch gedit in the background by doing `gedit&`. A gedit window should appear. Remove the word `BUG`, save the file and recompile. Do `./hello` to run the program.

- ▶ If you get this error:

WARNING **: cannot open display:
then you have missed the '-Y' in your SSH command

Part VI: HPC Job Submission

Exercise 10: Modules and Compilers

- ▶ The default version of gcc is 4.8.5. Compile `hello.c` again with `gcc 5.4.0`.

Hints: module av, module load gcc-5.4.0-gcc-4.8.5-fis24gg, then `gcc hello.c -o hello2`

Using HPC: Job Submission

Using HPC: Job Submission

- ▶ Compute resources are managed by a scheduler:
[SLURM/PBS/SGE/LSF/...](#)
- ▶ Jobs are submitted to the scheduler
 - analogous to submitting jobs to a print queue
 - a file (*submission script*) is copied and queued for processing.

Using HPC: Job Submission

- ▶ Jobs are submitted from the [login node](#)
 - not itself managed by the scheduler.
- ▶ Jobs may be either non-interactive ([batch](#)) or [interactive](#).
- ▶ [Batch](#) jobs run a shell script on the first of a list of allocated nodes.
- ▶ [Interactive](#) jobs provide a command line on the first of a list of allocated nodes.

Using HPC: Job Submission

- ▶ Jobs may use [part](#) or [all](#) of one or more nodes
 - the owner can specify `--exclusive` to force exclusive node access.
- ▶ Template submission scripts are available under
[/usr/local/Cluster-Docs/SLURM](#).

Job Submission: Using SLURM

- ▶ Prepare a shell script and submit it to SLURM:

```
[abc123@login-a-1]$ sbatch slurm_submission_script
Submitted batch job 790299
```

Job Submission: Show Queue

- Submitted job scripts are copied and stored in a queue:

```
[abc123@login-a-1]$ squeue -u abc123
JOBID PARTITION    NAME   USER ST      TIME  NODES NODELIST(REASON)
790299  skylake    Test3 abc123 PD      0:00     2 (PriorityResourcesAssocGrpCPUMinsLimit)
790290  skylake    Test2 abc123 R   27:56:10     2 cpu-a-[1,10]
```

Job Submission: Monitor Job

- Examine a particular job:

```
[abc123@login-a-1]$ scontrol show job=790290
```

Job Submission: Cancel Job

- Cancel a particular job:

```
[abc123@login-a-1]$ scancel 790290
```

Job Submission: Scripts

- SLURM

In [~/job_templates](#), see examples: [slurm_submit.skylake.generic](#), [slurm_submit.skylake.matlab](#).

```
#!/bin/bash
#! Name of the job:
#SBATCH -J myjob
#! Which project should be charged:
#SBATCH -A TRAINING-CPU
#! How many whole nodes should be allocated?
#SBATCH --nodes=1
#! How many tasks will there be in total? (<= nodes*32)
#SBATCH --ntasks=116
#! How much wallclock time will be required?
#SBATCH --time=02:00:00
#! Select partition:
#SBATCH -p skylake
...
```

- #SBATCH lines are *structured comments*
— correspond to sbatch command line options.

- The above job will be given 1 cpu16 cpus on 1 node for 2 hours
(by default there is 1 task per node, and 1 cpu per task).

Job Submission: Accounting Commands

- ▶ How many core hours available do I have?

```
mybalance
User      Usage |      Account      Usage | Account Limit Available (hours)
----- + ----- + -----
sjr20      3 | SUPPORT-CPU    2,929 | 22,425,600 22,422,671
sjr20      0 | SUPPORT-GPU     0 | 87,600   87,600
```

- ▶ How many core hours does some other project or user have?

```
gbalance -p SUPPORT-CPU
User      Usage |      Account      Usage | Account Limit Available (hours)
----- + ----- + -----
pfb29     2,925 | SUPPORT-CPU    2,929 | 22,425,600 22,422,671
sjr20 *     3 | SUPPORT-CPU    2,929 | 22,425,600 22,422,671
...
(Use -u for user.)
```

- ▶ List all jobs charged to a project/user between certain times:

```
gstatement -p SKYLAKE -u xyz10 -s "2018-04-01:00:00:00" -e "2018-04-30:00:00:00"
JobID   User  Account JobName Partition End ExitCode State Comphrs
263     xyz10 support-c++_interact+ skylake 2018-04-18T19:44:40 0:0 TIMEOUT    1.0
264     xyz10 support-c++_interact+ skylake 2018-04-18T19:48:07 0:0 CANCELLED+ 0.1
275     xyz10 support-c++_interact+ skylake Unknown       0:0 RUNNING    0.3
...
```

Job Submission: Single Node Jobs

- ▶ Serial jobs requiring large memory, or OpenMP codes.

```
#!/bin/bash
...
#SBATCH --nodes=1
#SBATCH --ntasks=1
# Default is 1 task per node
#SBATCH --cpus-per-task=
# Increasing --mem or --cpus-per-task implicitly increases the other
...
#SBATCH --mem=5990
# Memory per node in MB - default is pro rata by cpu number
# Increasing --mem or --cpus-per-task implicitly increases the other
...
export OMP_NUM_THREADS= # For OpenMP across cores
$application $options
...

```

Job Submission: Single Node Jobs

- ▶ Serial jobs requiring large memory, or OpenMP codes.

```
#!/bin/bash
...
#SBATCH --nodes=1
#SBATCH --ntasks=1
# Default is 1 task per node
#SBATCH --cpus-per-task=1
# Default is 1 cpu (core) per task
#SBATCH --mem=5990
# Memory per node in MB - default is pro rata by cpu number
# Increasing --mem or --cpus-per-task implicitly increases the other
...
export OMP_NUM_THREADS= # For OpenMP across cores
$application $options
...
```

Job Submission: Single Node Jobs

- ▶ Serial jobs requiring large memory, or OpenMP codes.

```
#!/bin/bash
...
#SBATCH --nodes=1
#SBATCH --ntasks=1
# Default is 1 task per node
#SBATCH --cpus-per-task=32 # Whole node
...
#SBATCH --mem=5990
# Memory per node in MB - default is pro rata by cpu number
# Increasing --mem or --cpus-per-task implicitly increases the other
...
export OMP_NUM_THREADS=32 # For OpenMP across 32 cores
$application $options
...
```

Job Submission: Single Node Jobs

- ▶ Serial jobs requiring large memory, or OpenMP codes.

```
#!/bin/bash
...
#SBATCH --nodes=1
#SBATCH --ntasks=1
# Default is 1 task per node
#SBATCH --cpus-per-task=16 # Half node

#SBATCH --mem=5990
# Memory per node in MB - default is pro rata by cpu number
# Increasing --mem or --cpus-per-task implicitly increases the other
...
export OMP_NUM_THREADS=16 # For OpenMP across 16 cores
$application $options
...
```

Job Submission: Single Node Jobs

- ▶ Serial jobs requiring large memory, or OpenMP codes.

```
#!/bin/bash
...
#SBATCH --nodes=1
#SBATCH --ntasks=1
# Default is 1 task per node
#SBATCH --cpus-per-task=32 # Whole node

#SBATCH --mem=5990
# Memory per node in MB - default is pro rata by cpu number
# Increasing --mem or --cpus-per-task implicitly increases the other
...
export OMP_NUM_THREADS=16 # For OpenMP across 16 cores (using all memory)
$application $options
...
```

Job Submission: MPI Jobs

- ▶ Parallel job across multiple nodes.

```
#!/bin/bash
...
#SBATCH --nodes=4
#SBATCH --ntasks=128      # i.e. 32x4 MPI tasks in total.
#SBATCH --cpus-per-task=2
...
mpirun -np 128 $application $options
...
```

- ▶ SLURM-aware MPI launches remote tasks via SLURM.
- ▶ The template script uses \$SLURM_TASKS_PER_NODE to set PPN.

Job Submission: MPI Jobs

- ▶ Parallel job across multiple nodes.

```
#!/bin/bash
...
#SBATCH --nodes=4
#SBATCH --ntasks=64      # i.e. 16x4 MPI tasks in total.
#SBATCH --cpus-per-task=2
...
mpirun -ppn 16 -np 64 $application $options
...
```

- ▶ SLURM-aware MPI launches remote tasks via SLURM.
- ▶ The template script uses \$SLURM_TASKS_PER_NODE to set PPN.

Job Submission: Hybrid Jobs

- ▶ Parallel jobs using both MPI and OpenMP.

```
#!/bin/bash
...
#SBATCH --nodes=4
#SBATCH --ntasks=64      # i.e. 16x4 MPI tasks in total.
#SBATCH --cpus-per-task=2
...
export OMP_NUM_THREADS=2  # i.e. 2 threads per MPI task.
mpirun -ppn 16 -np 64 $application $options
...
```

- ▶ This job uses 128 CPUs (each MPI task splits into 2 OpenMP threads).

Job Submission: High Throughput Jobs

- ▶ Multiple serial jobs across multiple nodes.
- ▶ Use `srun` to launch tasks ([job steps](#)) within a job.

```
#!/bin/bash
...
#SBATCH --nodes=2
...
cd directory_for_job1
srun --exclusive -N 1 -n 1 $application $options_for_job1 > output 2> err &
cd directory_for_job2
srun --exclusive -N 1 -n 1 $application $options_for_job2 > output 2> err &
...
cd directory_for_job64
srun --exclusive -N 1 -n 1 $application $options_for_job64 > output 2> err &
wait
```

If you are attending the HPC Course:

README: Job Scripts!

If you are attending the HPC Course:

- ▶ Use `job_script` for the exercises when running the exercises during the course
- ▶ Use `slurm_submit.peta4-skylake` if running the exercises outside of the course
- ▶ I recommend you make a copy of the job script for each exercise

Exercise 11: Submitting a Matlab job

- ▶ Submit a job which will run `matlab` on the `file.m` command file (which contains just the `ver` command).

Hints:

1. Edit the `job_script` in your exercises directory.
2. In the module load section: `module load matlab/r2017b`
3. Set the value of application to "`matlab -nodesktop -nosplash -nojvm`"
4. Set the value of options to "`-r file`"
5. Submit the job with `sbatch job_script`. The jobid is then printed.
6. Watch the job in the queue with `squeue`.
7. After it has disappeared, open the output file `slurm-jobid.out` in your editor. It should contain a list of licensed Matlab features.
8. For more demanding work you can increase the available memory by increasing the number of cpus.

Exercise 12: Submitting compiled code

- ▶ Submit a job which will run a copy of your `hello` program on 1 cpu.

Hints:

1. Edit the script `job_script` in your exercises directory.
Set:
`#SBATCH --nodes=1`
`#SBATCH --ntasks=1`
`application=./hello`
2. Submit the job with `sbatch job_script`. The jobid is then printed.
3. Watch the job in the queue with `squeue`.
4. After it has disappeared, open the output file `slurm-jobid.out` in your editor. There should be exactly one "Hello, World!" message.

Job Submission: Interactive

- ▶ Compute nodes are accessible via SSH while you have a job running on them.
- ▶ Alternatively, submit an interactive job:
`slintr -A TRAINING-CPU -N1 -n8 -t 2:0:0`
- ▶ Within the window (screen session):
 - * Launches a shell on the first node (when the job starts).
 - * Graphical applications should display correctly.
 - * Create new shells with `ctrl-a c`, navigate with `ctrl-a n` and `ctrl-a p`.
 - * `ssh` or `srun` can be used to start processes on any nodes in the job.
 - * SLURM-aware MPI will do this automatically.

Job Submission: Array Jobs

- ▶ http://slurm.schedmd.com/job_array.html
- ▶ Used for submitting and managing large sets of similar jobs.
- ▶ Each job in the array has the same `initial` options.
- ▶ SLURM

```
[abc123@login-a-1]$ sbatch --array=1-7:21,3,5,7 -A TRAINING-CPU submit_script
Submitted batch job 791609
```

```
[abc123@login-a-1]$ squeue -u abc123
      JOBID PARTITION    NAME     USER ST      TIME  NODES NODELIST(REASON)
 791609_1    skylake    hpl  abc123 R   0:06      1  cpu-a-6
 791609_3    skylake    hpl  abc123 R   0:06      1  cpu-a-16
 791609_5    skylake    hpl  abc123 R   0:06      1  cpu-a-7
 791609_7    skylake    hpl  abc123 R   0:06      1  cpu-a-7
```

791609_1, 791609_3, 791609_5, 791609_7

i.e. \${SLURM_ARRAY_JOB_ID} \${SLURM_ARRAY_TASK_ID}

SLURM_ARRAY_JOB_ID = SLURM_JOBID for the first element.

Job Submission: Array Jobs (ctd)

- ▶ Updates can be applied to specific array elements using `${SLURM_ARRAY_JOB_ID} . ${SLURM_ARRAY_TASK_ID}`
- ▶ Alternatively operate on the entire array via `${SLURM_ARRAY_JOB_ID}`.
- ▶ Some commands still require the SLURM_JOB_ID (sacct, sreport, sshare, sstat and a few others).
- ▶ Exercise 7 - Array Jobs.

Scheduling

- ▶ SLURM scheduling is multifactor:
 - ▶ QoS — payer or non-payer?
 - ▶ Age — how long has the job waited?
Don't cancel jobs that seem to wait too long.
 - ▶ Fair Share — how much recent usage?
Payers with little recent usage receive boost (not implemented yet).
 - ▶ `sprio -j jobid`
- ▶ Backfilling
 - ▶ Promote lower priority jobs into gaps left by higher priority jobs.
 - ▶ Demands that the higher priority jobs not be delayed.
 - ▶ Relies on reasonably accurate wall time requests for this to work.
 - ▶ Jobs of default length will not backfill readily.

Exercise 13: Array Jobs

- ▶ Submit your last job in the form of an array with indices 1-32. Use -H with sbatch to mark the array as held (so that it won't run immediately).
Hints:
 1. Use `sbatch -H --array=1-32 job_script`
 2. Use `squeue -u userid` to see your array job. Note that `-r` reports each array element individually.
- ▶ Release array element 1 and allow it to run. Then release the others.
Hints:
 1. Use `scontrol release ${SLURM_ARRAY_JOB_ID}.1`
 2. Use `squeue -u userid` again to watch what happens.
 3. Release the others with
`scontrol release ${SLURM_ARRAY_JOB_ID}`
i.e. use the array id to release the entire array.
 4. When all the jobs complete you should have 32 `slurm-${SLURM_ARRAY_JOB_ID}.N.out` files saying hello from various cpus on possibly multiple nodes.

Wait Times

- ▶ 12 or 36 hour job walltimes are permitted.
- ▶ SL3 jobs, 12hrs (non payers), SL2 and 1, 36hrs (payers)
- ▶ *This sets the timescale at busy times (without backfilling).*
- ▶ Use backfilling when possible.
- ▶ Short (1 hour or less) jobs have higher throughput.

- ▶ Insurance against failures during long jobs.
- ▶ Restart from checkpoints to work around finite job length.
- ▶ Application native methods are best. Failing that ...

▶ Do ...

- ▶ Give reasonably accurate wall times (allows [backfilling](#)).
- ▶ Check your balance occasionally ([mybalance](#)).
- ▶ Test on a small scale first.
- ▶ Implement [checkpointing](#) if possible (reduces resource wastage).

▶ Don't ...

- ▶ Request more than you need
 - you will wait longer and use more credits.
- ▶ Cancel jobs unnecessarily
 - priority increases over time.
